# SUGAR CANE TRIALS CLIENT: KISMET INTERNATIONAL PTY.LTD. For And On Behalf Of GUANO AUSTRALIA PTY.LTD. 49 FIELD ST, SHEPPARTON 3630, VICTORIA

**RESEARCH COMPANY:** 

CROP TECH PTY LTD 410 Langbeckers East Road Bundaberg 4670, Queensland

Ph +61 (0) 7 4155 6344 Fax +61 (0) 7 4155 6656 croptech@croptech.com.au www.croptech.com.au

1

## OVERVIEW

A crop nutrition trial was conducted in Bundaberg, to compare the effectiveness of MADURA GUANO GOLD – KWIK START® // REEFSAFE® FERTILISER (GUANO® / REEFSAFE®), against the conventional fertilisers, on sugar cane yield and commercial cane sugar (CCS) levels.

GUANO® / REEFSAFE® fertiliser is an organic di-calcium product, rich in 100% available Phosphorus, Calcium, Silica, Organic Carbon and a high CEC (Cation Exchange Capacity) product (see Appendix 1).

Other parameters monitored throughout the trial were shoot emergence, root development, and the uptake of the full range of nutrients, especially phosphorous and silica.

### INTRODUCTION

A trial site was established in the Bundaberg region. The site was representative of the area with respect to soil type, irrigation methods, and crop rotation systems. The field was approximately 4.5ha in area.

The site was planted on the 4<sup>th</sup> of September 2003. The previous sugar cane ration crop was ploughed out in the 2002 sugar cane crushing season. In the 12 month fallow period between cane crops the site grew a crop of soybeans, followed by oats.

## TRIAL DESIGN

The trial area was laid out as a Randomised Complete Block design, two treatments by 12 replicates, giving a total of 24 plots. The two treatments are shown in Table 1.

Treatment 1	Industry standard fertiliser applied at 250kg/ha (Incitec 2003/CB 27277, N P K S analysis 19.1 : 10 : 0 : 12.8)
Treatment 2	GUANO® / REEFSAFE® / Sulphate of Ammonia applied at 350kg/ha (N P K Ca S Si analysis 10.5 : 5.5 : 0 : 14.5 : 12 : 5)

Table 1: Treatments applied.

Each plot was three rows wide. The treatments were applied to the full length of the rows. The row orientation was east west.

#### METHODS AND MATERIALS

#### Pre-plant

The standard pre-plant land preparation was conducted. During land preparation a full soil test was taken and analysed. The results of the soil test and the standard fertiliser recommendation are shown in Appendix 2. Gypsum was applied to the total field at the rate of 2000kg/ha.

# Planting

The two treatment planting fertiliser rates are shown in Table 2.

Table	2:	Planting	fertiliser	rates.
-------	----	----------	------------	--------

Treatment	Ν	Р	κ	Са	S	Si
<b>GUANO® / REEFSAFE®</b>	37	20	0	51	42	17.5
Standard	48	25	0	0	32	0

The rows treated with the standard fertiliser were planted first. The GUANO® / REEFSAFE® treatment was planted the following day.

The field was planted with a conventional cane billet planter, as shown in Figure 1.

	Figure 1: GUANO®	/ REEFSAFE® rows	being planted.
--	------------------	------------------	----------------

## Post-planting

During the spring and summer period a number of agronomic attributes were monitored at the site.

Shoot emergence and root development was monitored at two months and five months post emergence.

Approximately three months after planting leaf samples were collected from the trial site for dried tissue analysis. One sample was taken from each of the plots (24 samples), while a combined sample was taken from across all plots, of each of the two treatments (two samples).

The 24 samples were analysed for total phosphorous and total silica, while the two samples were analysed for the full range of elements. The results are shown in Appendix 3 and 4 respectively.

### Side dress fertiliser application

One post plant application of fertiliser was applied at the site, approximately three months post planting. All plots in all treatments received 240 kg/ha of Muriate of Potash.

The total fertiliser applied to each treatment is shown in Table 3.

Treatment	Ν	Р	К	Са	S	Si
GUANO® / REEFSAFE®	37	20	120	51	42	17.5
Standard	48	25	120	0	32	0

Table 3: Total fertiliser rates.

#### Harvesting

Harvesting of the trial block took place on the 11<sup>th</sup> of October 2004, following commercial harvest procedures. The site was harvested working across the field, from north to south. The cane from each three row plot was loaded into five bins on the cane rail siding, adjacent to the farm. The bin numbers were documented to enable yield and CCS levels for each plot to be quantified. The total trial site was harvested within one day.

The cane was crushed within 24 hours of being harvested.

### RESULTS

#### Shoot emergence and Root appearance

Although no statistical analysis was performed on the shoot and root assessments, a number of trends were obvious.

At the spiking stage of the crop, total shoot numbers on the average appeared slightly lower on the GUANO® / REEFSAFE® treatments. However at this growth stage, the GUANO® / REEFSAFE® plants appeared to have a more aggressive root system (see Figure 2).

Figure 2: Superior root growth on GUANO® / REEFSAFE® treated plots.

**GUANO® / REEFSAFE® treatment** 

Standard treatment

The GUANO® / REEFSAFE® plants appeared to have a lower shoot count at this early stage, however this treatment appeared to have a larger number of shoots still emerging from the sett (see Figure 3).

Figure 3: Emerging shoots (two months post planting).

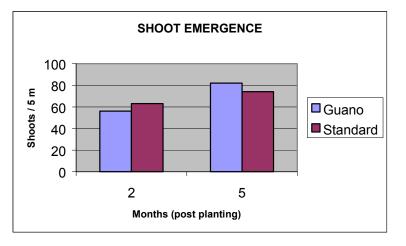

**GUANO® / REEFSAFE® sett** 

# Standard sett

By canopy closure the two treatments appeared to be almost comparable. Although the results were not analysed, the GUANO® / REEFSAFE® treatment had produced slightly more shoots than the standard treatment. The cane stalk length however was slightly shorter in that treatment. Figure 4 shows the progression of shoot counts.

Figure 4: Shoot counts over time.

Crop Tech Pty Ltd 410, Langbeckers East Road, Bundaberg, QLD 4670 Ph +61 (0) 7 4155 6344 Fax +61 (0) 7 4155 6656 croptech@croptech.com.au 5 www.croptech.com.au

# Dry Tissue

Dry tissue analysis of the two treatments showed significant differences in phosphorous and silica levels.

The GUANO® / REEFSAFE® treatment had significantly more phosphorous within the plant tissue, when compared to the standard treatment.

The GUANO® / REEFSAFE® treatment had significantly more silica (at the 1% level) within the plant tissue, when compared to the standard treatment.

The statistically analysed phosphorous and silica data are shown in Appendix 5.

### Harvest

Statistical analysis showed the same tonnes per hectare and sugar content were recorded for each treatment.

The statistically analysed CCS and yield data are shown in Appendix 5.

# DISCUSSION

The root/shoot ratio appeared to be higher in the GUANO® / REEFSAFE® treatment than the commercial treatment. This is probably due to a better uptake of phosphorus, calcium and silica, which all influence root growth. By canopy closure however, the GUANO® / REEFSAFE® treatment had produced slightly more shoots than the standard treatment.

The silica component in the GUANO® / REEFSAFE® fertiliser plays a significant role in driving the absorption of phosphorous and calcium. Leaf blade levels of phosphorous and silica were significantly higher in the GUANO® / REEFSAFE® treatment than the standard treatment. Silica releases locked up phosphorous in the soil, by exchanging on to lockup sites.

Results indicate that plants in the GUANO® / REEFSAFE® treatment absorbed more phosphorous, even though almost 20% extra phosphorous was applied to the standard treatment.

It should be noted the dry tissue analysis was conducted only three months post planting. With the continuous release action of phosphorous from GUANO® / REEFSAFE® fertiliser, and the nutrient enhancement of silica, it would be interesting to analyse the plant tissue in the following ration crop.

# CONCLUSION

Silica also plays a major role in increasing the cell strength of plant tissue, and thus the rigidity of the plant. The continuous release action of phosphorous from GUANO® / REEFSAFE® fertiliser may result in less lockup and leaching losses than conventional fertilisers. This would indicate that results from GUANO® / REEFSAFE® fertilisers may be more significant in lighter coastal soils, in high rainfall seasons.

Under the conditions of this trial, the GUANO® / REEFSAFE® fertiliser has performed as well as the standard fertiliser blends. At no extra cost to the grower, both CCS levels and crop yield have been maintained, when using MADURA GUANO GOLD – KWIK START® // REEFSAFE® FERTILISER.
